The NEW ENGLAND JOURNAL of MEDICINE

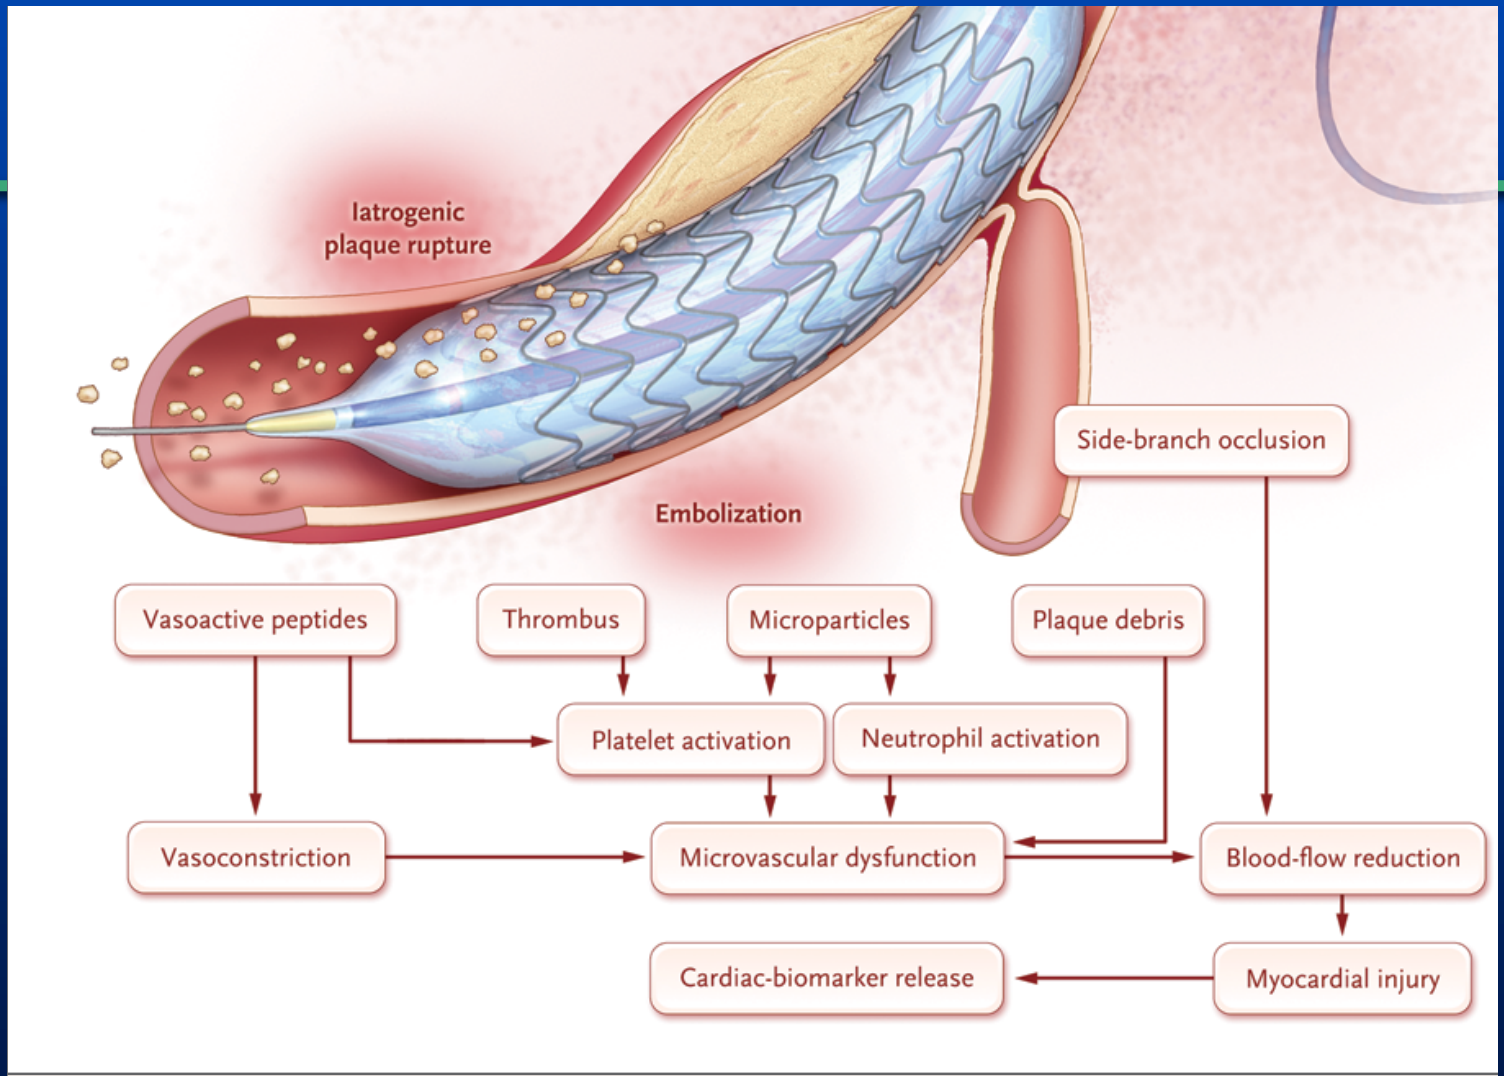

Figure 1. Mechanisms Underlying Periprocedural Myocardial Infarction.

Universal Definition of Myocardial Infarction

Kristian Thygesen; Joseph S. Alpert; Harvey D. White;
on behalf of the Joint ESC/ACCF/AHA/WHF Task Force
for the Redefinition of Myocardial Infarction

Table 1 Clinical classification of different types of myocardial infarction

Type 1
Spontaneous myocardial infarction related to ischaemia due to a primary coronary event such as plaque erosion and/or rupture, fissuring, or dissection

Type 2
Myocardial infarction secondary to ischaemia due to either increased oxygen demand or decreased supply, e.g. coronary artery spasm, coronary embolism, anaemia, arrhythmias, hypertension, or hypotension

Type 3
Sudden unexpected cardiac death, including cardiac arrest, often with symptoms suggestive of myocardial ischaemia, accompanied by presumably new ST elevation, or new LBBB, or evidence of fresh thrombus in a coronary artery by angiography and/or at autopsy, but death occurring before blood samples could be obtained, or at a time before the appearance of cardiac biomarkers in the blood

Type 4a
Myocardial infarction associated with PCI

Type 4b
Myocardial infarction associated with stent thrombosis as documented by angiography or at autopsy

Type 5
Myocardial infarction associated with CABG

There is currently no solid scientific basis for defining a biomarker threshold for the diagnosis of peri-procedural myocardial infarction. Pending further data, and by arbitrary convention, it is suggested to designate increases **more than three times** the 99th percentile URL as **PCI-related myocardial infarction** (type 4a).

STATE-OF-THE-ART PAPER

Inflammation in Atherosclerosis

From Pathophysiology to Practice

Peter Libby, MD,* Paul M Ridker, MD, MPH,*† Göran K. Hansson, MD, PHD,‡
for the Leducq Transatlantic Network on Atherothrombosis

Boston, Massachusetts; and Stockholm, Sweden

The advent of the cell biological era of atherosclerosis supplanted the simplistic concept of the atheroma as a passive deposition of lipid debris on the artery wall.

This revolution in our thinking about the pathophysiology of atherosclerosis has begun to provide clinical insight and practical tools that may aid patient management.

FOCUS ISSUE: PROVE IT-TIMI 22 State-of-the-Art Paper

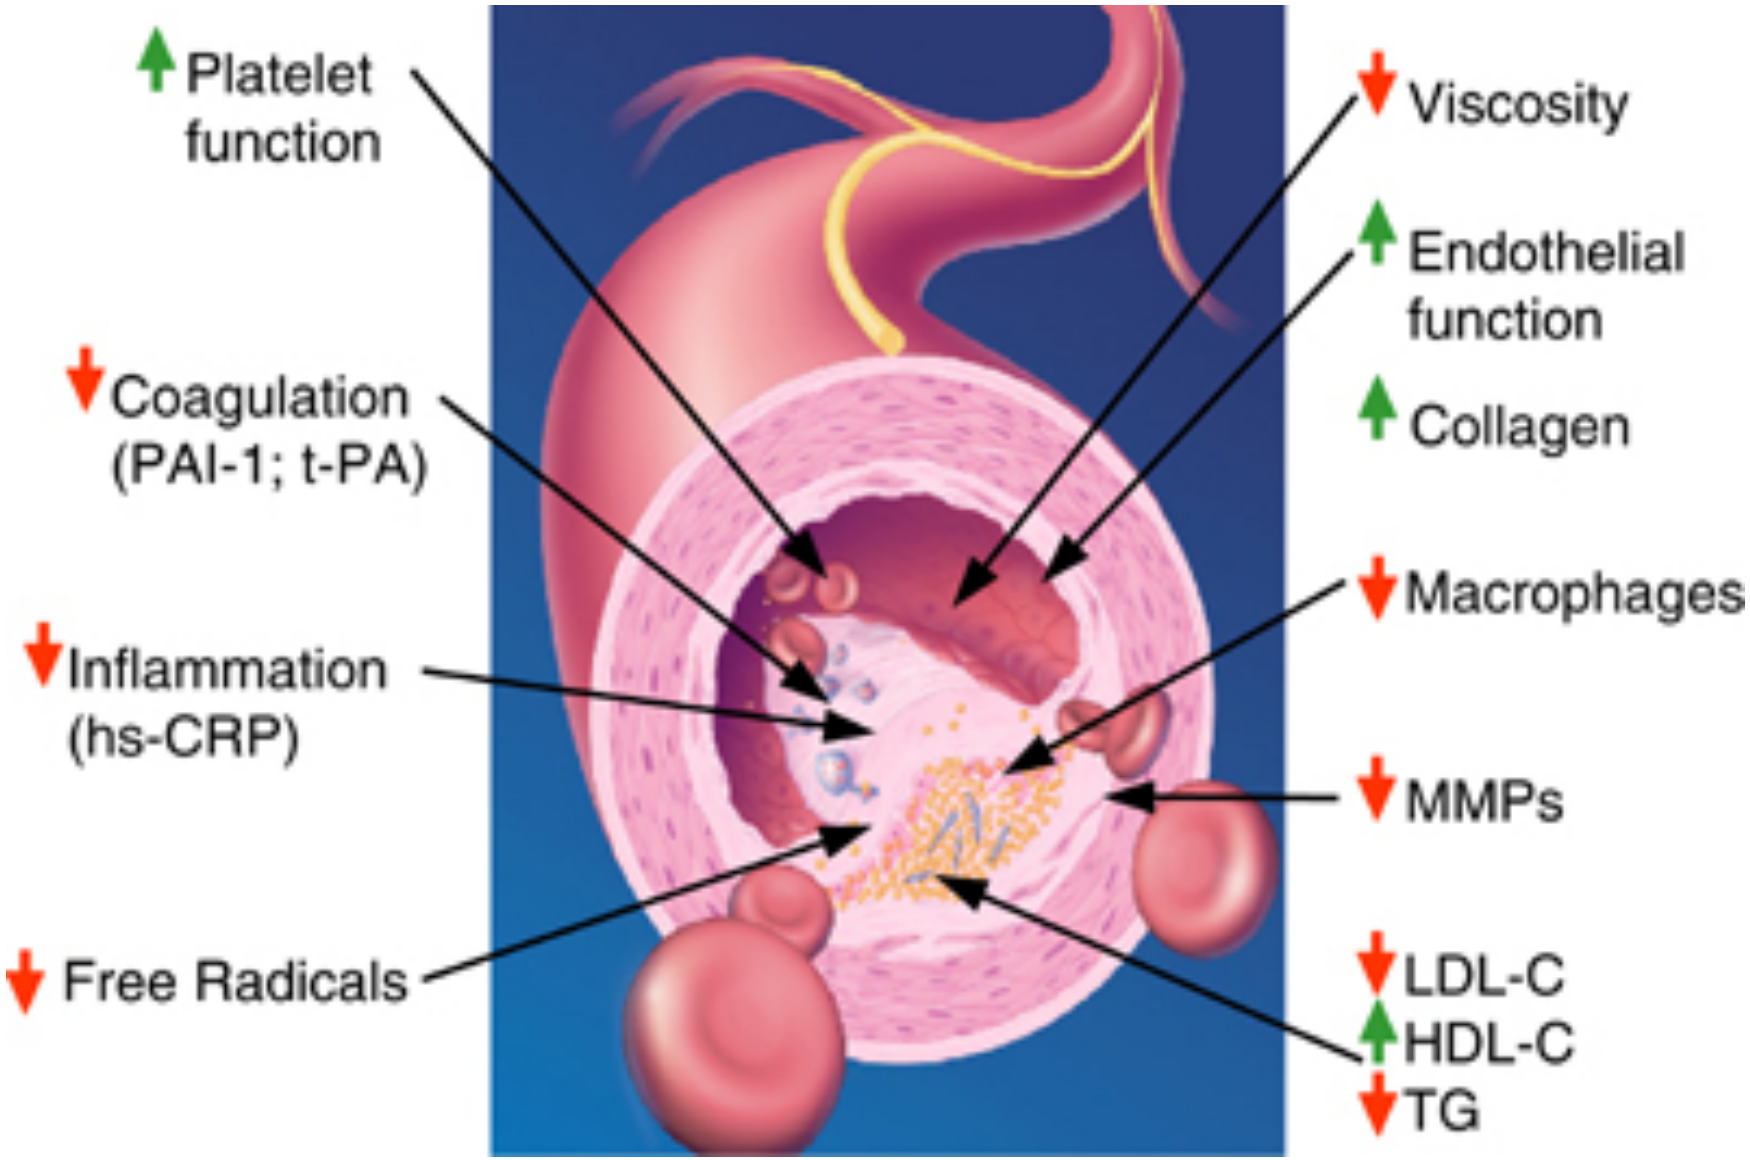
The Potential Relevance of the Multiple Lipid-Independent (Pleiotropic) Effects of Statins in the Management of Acute Coronary Syndromes

Kausik K. Ray, MRCP, MD, Christopher P. Cannon, MD, FACC
Boston, Massachusetts

Although a culprit thrombotic lesion may be treated effectively by antithrombotic therapy and revascularization, this will have little effect on the global processes that determine recurrent events at non-culprit sites.

Thus, additional systemic treatment is required

Statins possess multiple beneficial effects that are independent of low-density-lipoprotein cholesterol (LDL-C) lowering and that have favorable effects on **inflammation**, the **endothelium**, and the **coagulation cascade**.



Davignon J. (2004) Beneficial cardiovascular pleiotropic effects of statins. *Circulation* **109** (Suppl III) III–39-III-43.

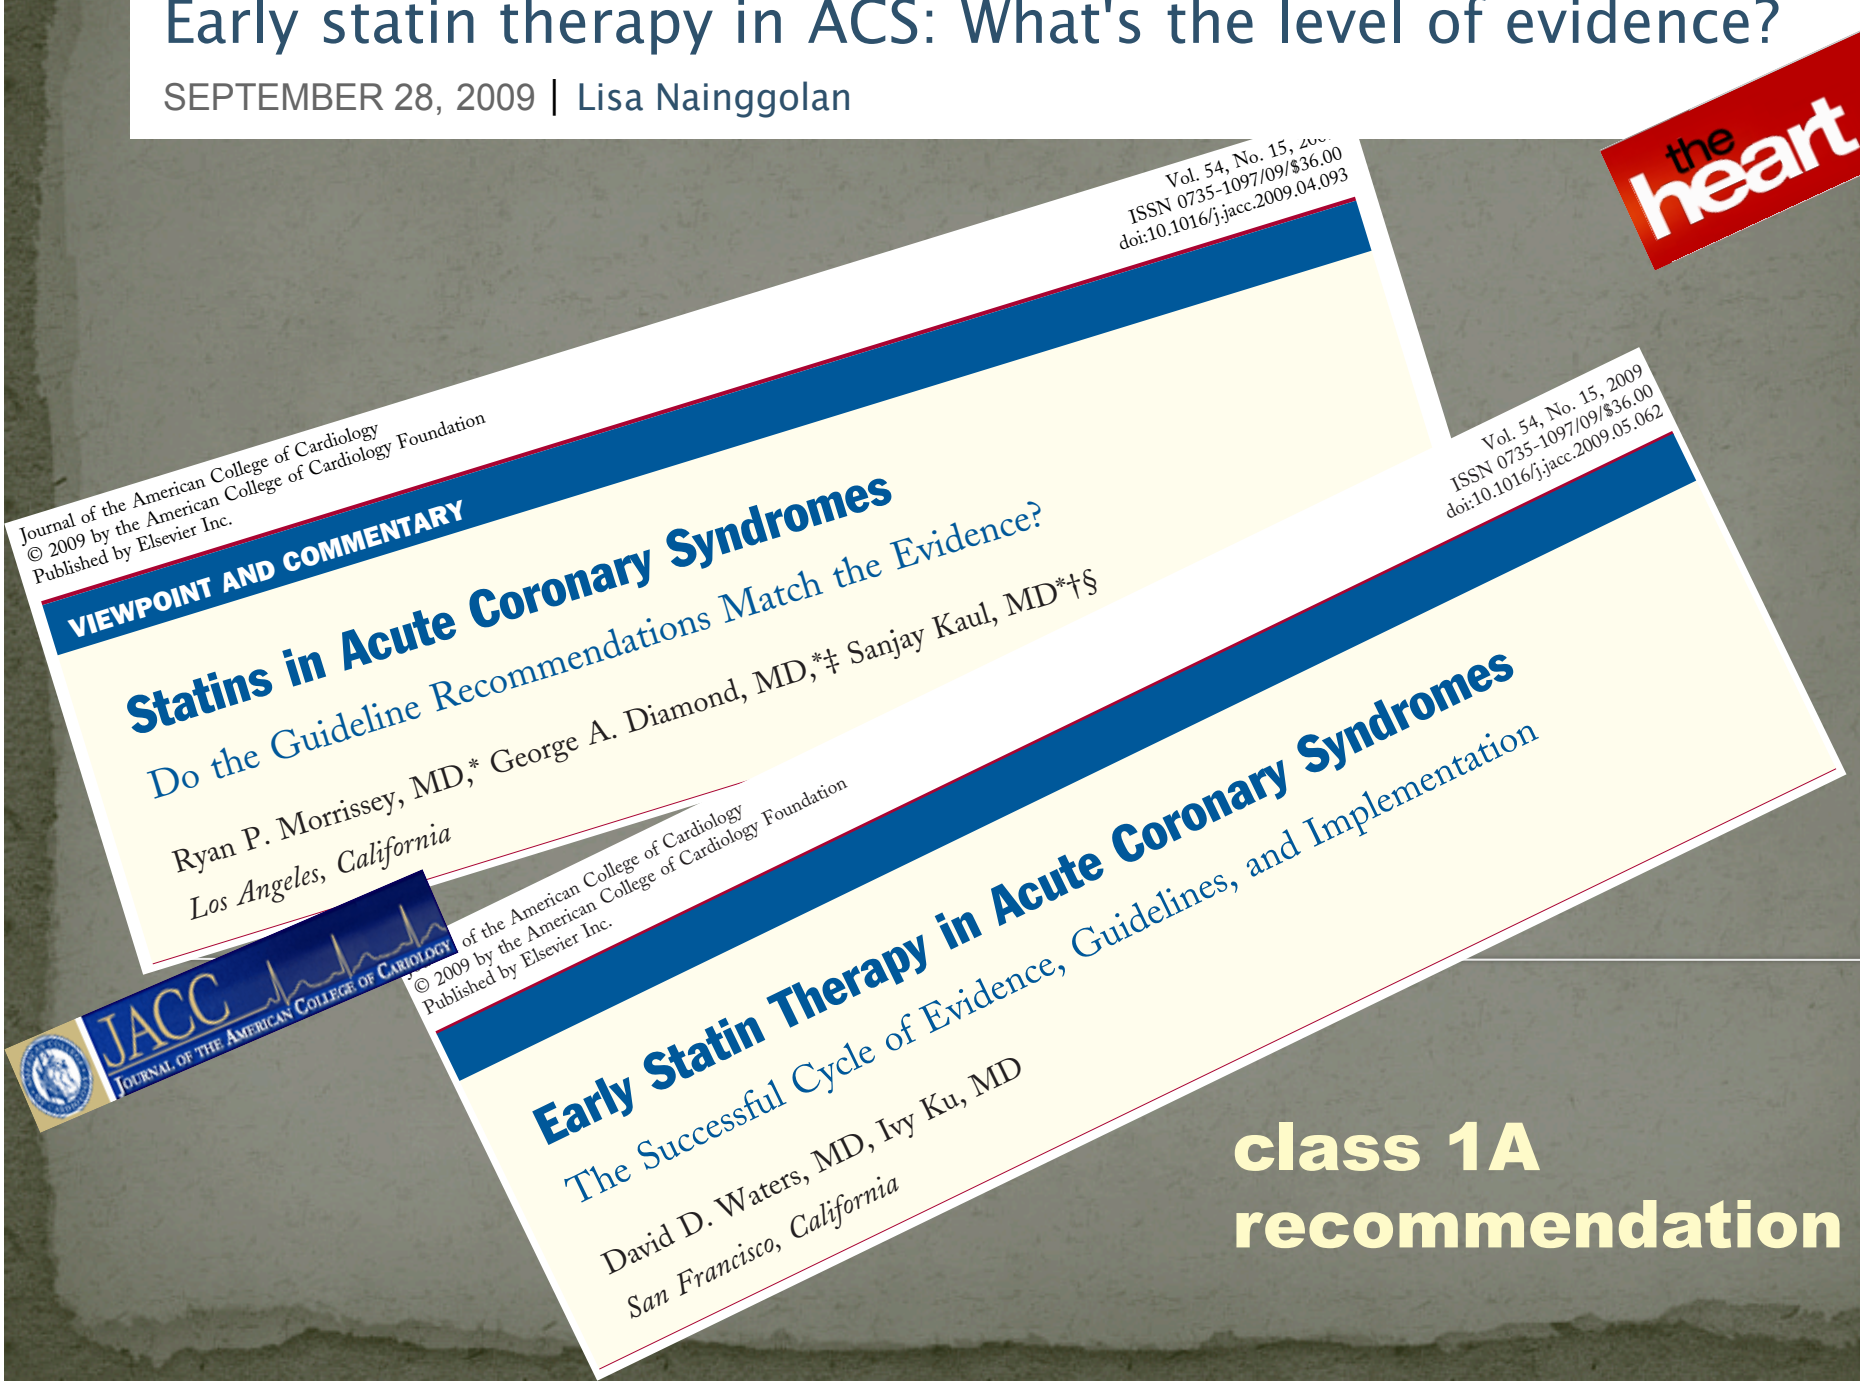
Early statin therapy in ACS: What's the level of evidence?

SEPTEMBER 28, 2009 | Lisa Nainggolan



Statins early in ACS should not be a class IA recommendation

> Here we have two professional societies looking at the same evidence and coming up with different recommendations.

As substance for his argument, he points out that the European guidelines on this "are somewhat more faithful to the evidence. They say to start early, within one to four days of ACS admission, but this is given a class IB rather than a class IA recommendation, and they put their target treatment level at <100 mg/dL. For the more aggressive treatment target of 70 mg/dL, they have a class IIA, level B recommendation," he notes, adding, "This is more in line with the evidence than the American guidelines. So here we have two professional societies looking at the same evidence and coming up with different recommendations—it's open to interpretation and it becomes more of an opinion."

***Dr Sanjay Kaul**, Cedars Sinai Medical Center, Los Angeles, CA*

Their choice, to attack this recommendation from among so many easier targets, seems quixotic.

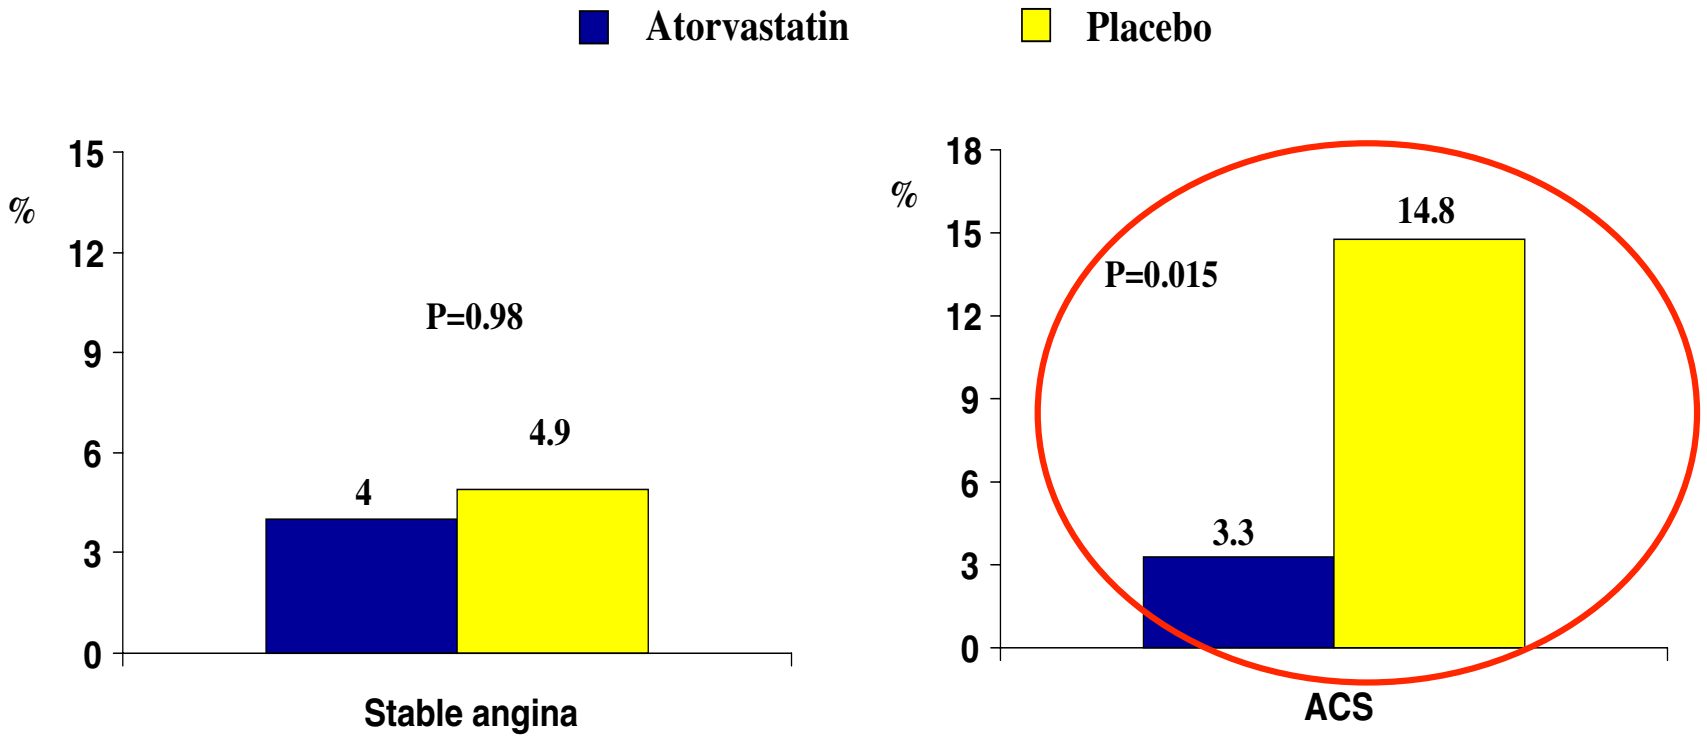
Armyda Recapture



Conclusions The ARMYDA-RECAPTURE trial suggests that reloading with high-dose atorvastatin improves the clinical outcome of patients on chronic statin therapy undergoing PCI. These findings may support a strategy of routine reload with high-dose atorvastatin early before intervention even in the background of chronic therapy. Statins Before Coronary Procedures

A New Indication for an Old Friend*

Kim A. Eagle, MD,† Vineet Chopra, MD‡

Ann Arbor, Michigan

JACC Vol. 56, No. 14, 2010 September 28, 2010:1110–2

Given the strong biological rationale and the sum of the clinical data,
no patient should undergo coronary procedures without statin therapy
unless clear contraindications exist.

Statine up-stream

Un carico di statina ad alto dosaggio

- Atorvastatina 80 mg
- Rosuvastatina 40 mg

Dovrebbe essere somministato pre-PCI

Come avviene per :

- ASA
- Tienopidinici (clopidiogrel/prasugrel)
- Eparina (UFH/Enoxaparin)

Il trattamento sistemico nelle ACS non può essere solo antitrombotico
